The Influence of Ethyl Alcohol on the Development of the Chondrocranium of Gallus gallus (Advances in Anatomy, Embryology and Cell Biology) Marise Heyns

According to Jones and Smith (1973) the potential adverse effect of maternal alcoholism on the development of the offspring has been referred to in early Greek and Roman mythology. In a Carthaginian ritual, the bridal couple was forbidden to drink wine on their wedding night in order that defective children might not be conceived (Haggard and Jellinek 1942). Also, according to Jones and Smith (1973,1975), the British House of Commons indicated in 1834, in a report by a select committee investigating drunkenness, that infants born to alcoholic mothers sometimes had a starved, shrivelled and imperfect look. According to Librizzi (1982) the first documented observations appeared in 1849 with the publication of the essay by Carpenter entitled "The Use and Abuse of Alcoholic Liquors in Health and Disease". He stated that habitual intemperance is the most potent of all causes of insanity because it aggravates the operation in other causes. Sullivan (1990) recorded increased abortion and stillbirth rates among chronically alcoholic mothers in a Liverpool prison and an increased incidence of epilepsy in their surviving offspring. Various investigators including Ladaque (1901), Roe (1944), Le comte (1950), Christiaens et al. (1960) and Lemoine et al. (1967) have since then reported increased incidence of abnormalities and decreased weight of surviving children born to chronic alcoholic mothers.
